

## **ABSTRACT**

[00023] The present utility model discloses a modified structure of a backpack umbrella support. The support is fixed on the backpack and has a holder on the top. The umbrella handle is mounted on the holder, which tilts towards the human body at an angle. For this reason, when the umbrella is fixed on the holder, the umbrella will tilt towards the human body, thereby covering the entire human body under the canopy of the umbrella, and providing better protection against the sunlight or rain.
